

RUMAHAGEN — Commercial + Payment Evidence Completion Pass

v1.0 — Current-State Evidence Retrieval / Alignment Gate

1. Objective

- Complete the missing current-state evidence pass required before Commercial + Payment Domain Model Impact & Alignment Review v1.1.
- Search the File Library for the current ERD, API Specification, RBAC/Permission Matrix and relevant System Architecture material, while preserving source terminology and avoiding inferred reconciliation.

2. Result Summary

- System Architecture evidence is now available and materially improves the impact assessment.
- User Flow and PRD evidence are available and confirm the existing RBAC/admin baseline and the legacy product scope.
- The exact current ERD v1.1 and API Specification v1.1 artifacts were not retrieved from the File Library despite targeted searches using exact and semantic queries.
- No dedicated payment/subscription entitlement permission matrix was retrieved.
- Therefore the evidence completion pass is PARTIAL, not complete.

3. Evidence Matrix

Artifact	Evidence Retrieved	Result	Caveat	Classification
SYSTEM-ARCHITECTURE	Retrieved: SYSTEM-ARCHITECTURE (7).md v1.6 and SYSTEM-ARCHITECTURE.md v1.0	PASS — current architecture hierarchy and technical structure can be inspected.	Full monetization/payment section is not established as a dedicated current-state section; further targeted review remains required.	Partial / usable evidence
User-Flow	Retrieved: User-Flow-Real-Estate-Agency-Platform.md	PASS — RBAC/admin flow and permission enforcement are explicit.	No dedicated subscription/payment/checkout flow found in retrieved evidence.	Partial / usable evidence
PRD	Retrieved: PRD-Real-Estate-Agency-Platform.md	PASS — current PRD confirms existing module scope and current monetization was listed as a pre-development confirmation item; payment/commission automation appears in later roadmap.	It does not provide the evolved Subscription/Entitlement/Payment model now governed by MADCR-011/002/003/005.	Partial / legacy/current baseline
RBAC / Permission	Retrieved through PRD/User-Flow sections: role/permission matrix, Superadmin/Admin/Manager/Agent behavior and backend permission checks.	PASS for existing RBAC baseline.	No dedicated payment/subscription entitlement permission matrix was found; must not infer it.	Evidence gap for payment impact

Artifact	Evidence Retrieved	Result	Caveat	Classification
ERD v1.1	Governance documents identify ERD-Skema-Data base-Real-Estate-Agency-v1.1 as approved logical DB source, but exact ERD artifact was not retrieved by File Library search.	NOT VERIFIED — no entity/table-level inspection possible.	Cannot claim entity conflict, alignment, or required delta.	Blocking evidence gap
API v1.1	Governance documents identify API-Specification-Real-Estate-Agency-Platform-v1.1 as API source of truth, but exact API artifact was not retrieved by File Library search.	NOT VERIFIED — no endpoint/contract-level inspection possible.	Cannot claim endpoint conflict, alignment, or required delta.	Blocking evidence gap
Commercial/Payment AEP	Retrieved AEP Monetization v1.0 and Monetization Evolution v1.1.	PASS — governing decision direction and downstream update order are explicit.	AEP remains translation/reference; approved ADRs and BR baseline govern.	Strong evidence
Approved Payment ADRs	ADR-011, ADR-002, ADR-003, ADR-005 retrieved.	PASS — complete approved Payment decision chain available.	No reopening indicated.	Strong evidence

4. Important Findings

- The existing System Architecture establishes an explicit document hierarchy in which approved ADRs govern architecture decisions and the System Architecture must reflect them. This is compatible with the current Payment ADR chain.
- The current PRD/User Flow contain an older product baseline where monetization/payment automation was still listed as a future/confirmation area. They therefore cannot be treated as evidence that the newly approved Payment architecture already exists in the current downstream model.
- The current RBAC baseline is role/module oriented and enforces permissions at backend request execution; it does not establish the evolved commercial entitlement model. User Flow explicitly shows Superadmin/Admin/Manager/Agent permission management and backend revalidation.
- The Monetization AEP explicitly requires synchronization against ERD, API, RBAC, User Flow and PRD and says contradictions must be identified rather than silently resolved.

5. Gate Assessment

- ARCHITECTURE DECISION READINESS: PASS — the Payment decision chain is complete and coherent.
- CURRENT-STATE DOWNSTREAM ALIGNMENT: HOLD — exact ERD and API artifacts remain unverified.
- RBAC PAYMENT IMPACT: HOLD — existing RBAC baseline is known, but payment/subscription-specific permissions are not evidenced.
- ERD UPDATE AUTHORIZATION: NOT GRANTED.
- API UPDATE AUTHORIZATION: NOT GRANTED.
- NEW MADCR: NONE IDENTIFIED from this pass.

6. Lead Decision

- Do not create an ERD delta or API delta from assumptions.
- Do not mark Domain Model Impact & Alignment Review v1.1 as PASS.
- Keep the project at Evidence Completion / Current-State Alignment HOLD until the exact ERD and API artifacts are available and inspected.

- If those exact files exist in the user's File Library but are not retrievable by search, the correct action is for the user to attach/upload those artifacts in this conversation rather than allowing the model to reconstruct them from memory or references.

7. Next Formal Gate

- Once ERD and API are available, run Commercial + Payment Domain Model Impact & Alignment Review v1.1.
- Compare existing entities/relationships against the governing logical model and classify every difference as KEEP / EVOLVE / LEGACY / MISSING / CONFLICT / OPEN DECISION.
- Only after that gate passes should the project produce a controlled ERD synchronization specification.
